

Five Important Reasons to Immunize Your Child From the U.S. Centers for Disease Control and Prevention

You want to do what is best for your children. You know about the importance of car seats, baby gates, and other ways to keep them safe. But did you know that one of the best ways to protect your children is to make sure they have all of their vaccinations?

1. Immunizations can save your child's life. Because of advances in medical science, your child can be protected against more diseases than ever before. Some diseases that once injured or killed thousands of children have been eliminated, and others are close to being gone – primarily due to safe and effective vaccines. One example of the great impact vaccines can have is the eradication of polio in the United States. Polio was once our most-feared disease causing death and paralysis, but today, thanks to vaccination, there are no reports of polio in the United States.

2. Vaccination is safe and effective. Vaccines are only given to children after a long and careful review by scientists, doctors, and healthcare professionals. Vaccines will involve some discomfort and may cause pain, redness, or tenderness at the site of injection, but this is minimal compared to the pain, discomfort, and trauma of the diseases these vaccines prevent. The most comprehensive scientific studies and reviews have found no link between vaccines and autism. The American Academy of Pediatrics, the Institute of Medicine (IOM), the National Institute of Health (NIH), the Centers for Disease Control and Prevention (CDC), and other federal agencies also agree that vaccines are not responsible for the number of children now recognized to have autism.

3. Immunization protects others you care about. Serious vaccine-preventable diseases still occur. Unfortunately, some babies are too young to be completely vaccinated, and some people may not be able to receive vaccinations due to allergies, illness, weakened immune systems, or other reasons. To help keep these individuals safe, it is important that you and everyone else in your family be immunized. This not only protects your family, but it also helps prevent the spread of these diseases to your friends and loved ones.

4. Immunizations can save your family time and money. A child with a vaccine-preventable disease can be kept out of schools or daycare facilities. A prolonged illness can take a financial toll because of lost time at work, medical bills, or long-term disability care. In comparison, vaccination against these diseases is a good investment and usually covered by insurance. Vaccines for Children is a federally funded program that provides vaccines at no cost to children who might not otherwise be vaccinated because of inability to pay. To find out more about the VFC program, visit, www.cdc.gov/vaccines/programs/vfc/ or ask your child's healthcare provider.

5. Immunization protects future generations. Vaccines have reduced and, in some cases, eliminated many diseases that killed or severely disabled people just a few generations before. For example, smallpox vaccination helped eradicate that disease worldwide. Your children don't have to get smallpox shots any more because the disease no longer exists. If we keep vaccinating now, parents in the future may be able to trust that diseases like polio and measles won't infect, cripple, or kill children.
