

This is why I want GMO labeling on food!

A study published last week in the peer-reviewed [Journal of Applied Toxicology](#) revealed that genetically modified corn containing the genes for Bt (*Bacillus thuringiensis*) is toxic to humans. The study further revealed that the herbicide known as Roundup is toxic to humans, even at small exposures. The vast majority of the corn grown in the U.S. has been engineered to contain Bt and is sprayed with Roundup during the growing process.
