

Before we use tax payer money to subsidize conversions from oil to natural gas, we must require that the homes building shell be brought up to a minimum insulation and air tightness standard. I cannot believe that we are again wasting our natural resources. Why not leave some energy resources for future generations?

If the nation cannot come up with a comprehensive energy plan then Connecticut should. Perhaps a tax on cheap energy sources would be beneficial. It would improve the economics of conservation, fund more conservation measures, stimulate the local economy, leave future generations better off and not penalize people who are unable to make the conversion.
