

Bill 1138 puts too little emphasis on conservation and renewable energy and WAY too much emphasis on using up our planet's finite fossil fuels.

Why race to use up these precious resources, backing ourselves permanently into energy poverty? Now is the time to be thoughtful about how to use our current energy resources to design and build energy systems that can sustain us into the indefinite future, not to rush to use up resources that can never be replaced. We are discovering that our planetary oil resources are limited; gas is also limited; even uranium is limited. We must begin to seriously cultivate distributed generation of power from local, renewable sources.
