

I strongly oppose the ban on plastic bags used to carry out goods from supermarkets, drug stores and big box stores like Walmart.

Many if not most of these bags find a second life as trash bags, bags we use to distribute items from our food pantry, or bags used to pick of doggie do, etc.

Does the Committee have a scientific report that describes the differences between these "free" bags and the ones that I will now be required to purchase for trash. Or to you suggest that trash go into the trash barrel unbagged?

Thank you,  
Frances C. Pascale
