

To whom it may concern,

I am opposed to the deposit of hydraulic fracturing waste in the state of Connecticut. This is not something that I am just being a "NIMBY" about, as I oppose fracking ANYWHERE, and feel that the waste shouldn't be generated in the first place.

I have great confidence that you have been contacted by many who can speak the the science of this issue better than I, people who have spoken in detail about the damages being done by the fracking, and by the waste left from the process.

I prefer speaking about our responsibility to manage our environment in a protective and careful way, to protect the future of our ecosystem, and of our children and theirs, who will live in it when we are gone. We only have the one chance, if we allow our lands & waters to be screwed up that's it. Game over.

...and if we are foolish enough to think we can go for the Easy Answer now and that some smart "kid" in the future will figure out how to clean it up at a later date, well, how is that to happen if that same kid with potential ends up having learning disabilities (or DIES) because of the pollution in their environment?

...And who will be paying for all the woes & illnesses that child with so much potential goes through, and so many others might endure, that were caused by the pollution of fracking waste? Yes. The taxpayers. We citizens have better things to do with our tax dollars than to "fix" stuff that shouldn't have been broken in the first place.

That this HB-6329 is concerning a ban on the wastes, and not seeking to import them, is something that I'm taking as a Good Sign.

Please: keep up the Good Work,...and Thank You.

Most Sincerely,

Annie Clark
