

Trophy carp take several years to big. Anyone that's just wanting to kill them is doing far more harm than good. Anyone knows that biomass is what supports so many pounds of carp. Example of 100 per acre. So you can have 5 x 20lbs or 10 x 10lbs or 20 x 5lbs carp. If you kill a trophy you just create a vacuum for small carp. That's a fact. Plus older carp do not spawn as well as younger carp, just like people!

I'd be glad to set down with any of the anti carp/ pro carp killers and discuss this and help educate them.

You are doing the right thing protecting them from an environmental stand point also the catch and. Release anglers standpoint. People that want to kill and waste them don't need trophy carp or more than 5 a day they are wasting anyway.
