

From: Diane Connors  
To: Children's Committee of the CT General Assembly  
Issue: HB-7005  
February 6, 2019

Greetings,

As a CT citizen, I'm am reaching out to voice my concern over House Bill 7005. I am adamantly opposed to this bill for many reasons. Here are some of them, based on solid data. If I had more time to write this, I would easily be able to add more. I trust that others who give testimony, will do so.

\* The fact is, **among all American physicians, there is strong disagreement about the safety and efficacy of vaccines.** It is an error for anyone here today to believe that physicians and other people who work in the medical field, are all in favor of vaccines. They are not only controversial among the public, but also within the medical field.

Some important points to consider:

**\*There are zero vaccine clinical trials that have been done on human beings.**

\*An organization called, "Physicians For Informed Consent" publishes a plethora of factual information about vaccine safety and efficacy on their website, as well as additional related data.

\*Volume 21, Issue #2 of the Journal of American Physicians and Surgeons published a 5-page report titled, "Combing Childhood Vaccines at One Visit is Not Safe", citing in its conclusion, that, "**The safety of the CDC's childhood vaccine schedule was never affirmed in clinical studies. Vaccines are administered to millions of infants every year, yet health authorities have no scientific data from synergistic toxicity studies on all combinations of vaccines that infants are likely to receive.** National vaccination campaigns must be supported by scientific evidence. No child should be subjected to a health policy that is not based on sound scientific principles and, in fact, has been shown to be potentially dangerous."

\* According to neurosurgeon Russell Blaylock, MD: You'd be amazed at the number of physicians, you ask them what's in a vaccine? They don't know about these other chemicals in there like formaldehyde, special proteins, special lipids **that are known to be brain toxic, that are known to induce autoimmunity in the brain.** They don't know that MSG is in a lot of vaccines—monosodium glutamate, a brain excitotoxin. They're not aware of what's in the vaccine they're giving.<sup>3</sup>

\* Pediatrician Larry Palevsky, MD has noted: There are a number of ingredients in the vaccines, and it was only after 15 years of being in medicine that a mother came up to me in 1998 and said did you know that there was [mercury](#) in vaccine? **Most of the public, and most of my colleagues in medicine, are unaware that small particles of these products are being injected into children, and most children are receiving almost all of them at once because they're receiving so many vaccines at the same time.**

**\* Doctors and Scientists Unite to End Mandatory Vaccination Laws**

Group Dedicated to Safeguarding Informed Consent  
FOR IMMEDIATE RELEASE: December 20, 2016  
CONTACT: [pr@picphysicians.org](mailto:pr@picphysicians.org)

Parents and doctors—not politicians—should be making medical decisions for children. A newly launched nonprofit called Physicians for Informed Consent (PIC) is now joining the cause to get the government out of some of the most important conversations parents have with their pediatrician. PIC is dedicated to raising public awareness about the problems posed for both parents and doctors by mandatory vaccination laws. Politicians have forced their way into the conversation about one of the most important

medical decisions families will make in consultation with their doctors.

\* What Doctors Learn in Medical School About Vaccines

by Marco Cáceres

Published July 27, 2018

“The idea that there are “medical experts” who, by virtue of the MD initials placed after their names, automatically know more than anyone else about vaccines is pervasive. This commonly held belief persists, **despite overwhelming evidence that doctors are taught almost nothing about vaccines in medical school.**”

“They are not trained to evaluate the toxic effects of chemicals, especially at the research level. One, they don’t do research programs, they don’t have the insight that’s developed and required for someone writing a PhD thesis in toxicology or biochemistry of materials that inhibit enzymes. They just don’t understand the science and the chemistry at that level. **And certainly pediatricians don’t.**”

“Medical school does not train future doctors to be vaccine experts. In fact, unless they took personal initiative and independently studied up on vaccines, those who graduate from medical school tend to be functionally illiterate about the subject. This aura of all-knowingness surrounding physicians, the common belief that they are vaccine experts, is wholly undeserved. That is why, increasingly, people are hesitant to rely solely on pediatricians and other medical doctors for guidance when it comes to vaccination, especially parents making a vaccine decision for their child.”

With all of this information (which is the tip of the iceberg) on the dangers of vaccines, one can feel fear about how they can possibly sustain good health for their children, against these dreaded childhood diseases. First of all, these diseases are very rarely deadly. Second of all, there really are natural ways to easily optimize one’s immune system health. There is a lot of data on that topic. This is an unpolished version of my testimony, because my understanding is that the deadline to email this is within the next few hours. So, I send it to you with solid information, though still incomplete. I know that you’re going to hear much more information along this line. Please take it seriously. There is much more to the story than what mainstream medicine says or has to offer. So much so, that they are themselves a house divided on the issue of vaccine safety and efficacy.

It is our constitutional RIGHT to the upbringing of our own children as we believe to be in their best interest. It’s not at all the government’s job to MANDATE that we force vaccines on children, with full foreknowledge that they are NOT proven safe or effective. Further, there is significant, solid data to at least cause serious pause for anyone – because they are NOT SAFE, and can – and do – cause harm, and death, to innocent children.
