

Consider the possibility of installing a cost effective and non-intrusive method of protection consisting of intrusion technology that is currently employed by many pharmaceutical warehouses to detect unauthorized entry. Namely reinforced glass fitted with shatter/ vibration activated contacts on all windows and doors feeding by hard wire and wireless to an off-site central alarm and town emergency center monitored 24/7. Local alarm installers in each town could be contracted. This would be part of a layered security plan and hopefully cut down incident response time to a minimum and negate the need for a telephone call to the 911 system.
