

Connecticut General Assembly
Bipartisan Task Force on Gun Violence Prevention & Children's Safety
Gun Violence Prevention Working Group

January 28, 2013

My name is John Chunis. I live in Rocky Hill, CT. I am the father of three grown children, and an expecting grandparent.

I am a Professional Engineer, Licensed in the State of Connecticut. Having worked a good portion of my career in root cause analysis and the development of corrective actions at the Millstone Nuclear Station, I have a strong appreciation for data when making conclusions, some of which I would like to share with you.

When looking at our neighboring states in the Northeast, data from the FBI (Table 1) shows that Vermont, New Hampshire, Maine and Rhode Island have lower per capita murder rates, yet they have the least restrictive gun control laws. One must ask why? Are they more civilized than us? Or is it that criminals tend to congregate in areas where they know their prey are more likely to be undefended, that is, where gun control laws restrict law abiding citizens.

It has been asked, why does anyone need a military style looking gun or a 30 round magazine for defense. Ask the Korean property owners who lived through the LA riots of 1992. Or perhaps, ask Dr. Petit or anyone else who survived a home invasion. Also, just the sight of an AR-15 in the hands of a homeowner, would likely scare away the intruders without a shot being fired. That is the best form of self-defense.

When looking at the murder rates by weapon (Table 2), data from the FBI shows that murder by rifles (which is the category of one of the weapon used in the Sandy Hook tragedy), is the lowest contributor (2.6%) of all the categories examined, below; shotguns (2.8%), hands and fists (5.7%), other non-firearm weapons (13.1%) and, knives and cutting weapons (13.4%). Further controls now, on the lowest contributor to the overall murder rate, does not make sense, and will have a negligible impact on reducing gun violence.

When it comes down to it, we kill more people due to distracted drivers on our highways than we do by assault weapons. Latest NHTSA data (reference 1) shows that 3,092 people were killed in 2010 due to distracted drivers, almost 10 times the number killed by rifles. When I heard US Senator Feinstein emotionally proclaim last week that "we must stop the killing, killing and killing, and now is our chance", I thought she was referring to cellphones, but I was wrong.

Finally, when looking at historical trends (Table 3), murder rates did initially decrease in the mid 90's when the federal assault weapon ban was introduced. However, this was mainly due to reduced murders by handguns, which is the major contributor to the overall murder rate, and not assault weapons. A slight increase occurred in the years just before expiration in 2004 and peaked in 2006. What is interesting is that the trend after that declined even further and continues to decline even without the ban. It is also interesting to note, that the murder rate

due to rifles (including assault weapons) in 2011 was lower than any year that the federal ban was in effect, and it continues to decrease. This is opposite of what one would expect if there was a true relationship between the assault weapon ban and gun violence.

So then, how is the decline in murder rate in the mid 90's explained? Steven Levitt, Professor of Economics, University of Chicago performed a detailed analysis of crime rates in the 1990s (reference 2) and concludes that the decline was not due to gun control measures but due to:

1. increases in the number of police,
2. increased incarceration and longer sentences,
3. receding crack cocaine epidemic, and
4. legalization of abortion in 1973, resulting in significantly fewer unwanted children 20 years later, who would have a greater propensity for crime.

This does appear astounding, but it makes sense and provides a consistent explanation to the entire trend. Based on this, one would conclude that the federal assault weapon ban of 1994 did little to reduce overall murder rates.

In conclusion, imposing further irrational gun control measures, based on an emotional hysteria over a low probability horrific event, instead of a detailed examination of the data, will only be a step in the wrong direction, and may potentially have more adverse consequences.

I appreciate your time and allowing me to present my views. Thank you.
